**Discoid Meniscus – How I do**

T. Tischer

5th Advanced Course on Knee Surgery, Val d'isere, 2.-7.2.2014

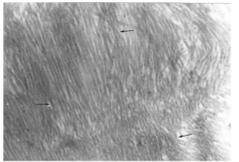

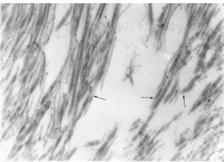

**Some facts !**

- First described by Young in 1889
- Congenital development
- 0.4 – 16.6 %
- Slightly higher in asian population
- Lateral >> medial
- Bilateral about 20%
- “Snapping knee syndrom” in children

Universitätmedizin Rostock

**Ultrastructure**

Organized collagen arrangement is lost:  
disorganized and decreased number of collagen fibers

Normal meniscus	Discoid meniscus
	

Electron micrograph x20.000

**Classification**

**Watanabe classification**

- I: complete type
- II: incomplete type
- III: Wrisberg ligament type

Type I Type II Type III 0-33%

**Jordan classification**

- Peripheral Stability (stable/unstable)
- Type of discoid meniscus (complete/incomplete/Wrisberg)
- Presence of meniscal tear
- Clinical symptoms (symptomatic/asymptomatic)

Jordan et al. J Am Acad Orthop Surg 1996

Universitätmedizin Rostock

**MRI diagnosis**

Three or more 5mm thick sagittal sections demonstrate continuity between anterior and posterior parts

Information about intrasubstance tears or degeneration  
-> surgical planning

Samoto et al. Magnetic Resonance Imaging 2002

Universitätmedizin Rostock

**Treatment: how I do**

- Conservative treatment if asymptomatic
- Partial meniscectomy
- Partial meniscectomy with repair
- (Subtotal/total meniscectomy)

Resection vs. Repair ?

- + Tissue is inherently abnormal
- Late degenerative changes

Universitätmedizin Rostock

**Surgical Technique** 7

Arthroscopic portals:  
 3 portals, don't struggle with 2  
 probe with spinal needle

Probe for peripheral rim instability!

Partial meniscectomy: "saucerization" (bitters and shavers)

Kim et al. Arthroscopy 2005  
 Universitätsmedizin Rostock

**Surgical Technique** 8

Leave rim of about 8mm width

Ahn et al. Arthroscopy 2008  
 Universitätsmedizin Rostock

**Surgical Technique** 9

Difficult to resect with peripheral tear  
 -> Temporary reposition using sutures

Ahn et al. Arthroscopy 2008  
 Universitätsmedizin Rostock

**Surgical Technique** 10

Additional suture with instability or peripheral tear (about 30%):  
 Standard repair: healing stimulation and inside-out, outside-in, all-inside depending on tear localization

All inside using suture hook through posterolateral portal

Universitätsmedizin Rostock

**Surgical Technique** 11

**Cave:** all-inside using suture anchors in children

- size of implants
- proximity of neurovascular structures

F, 8yrs  
 distance <4mm

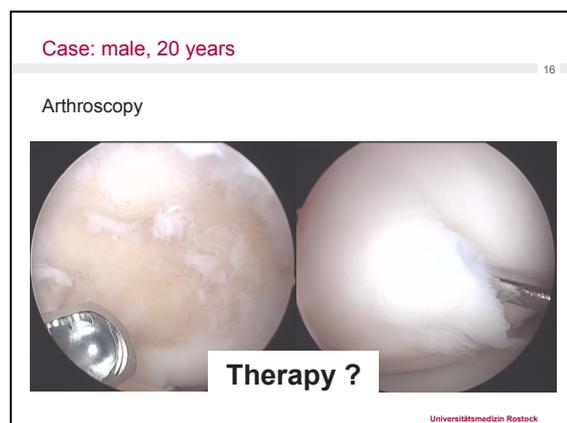

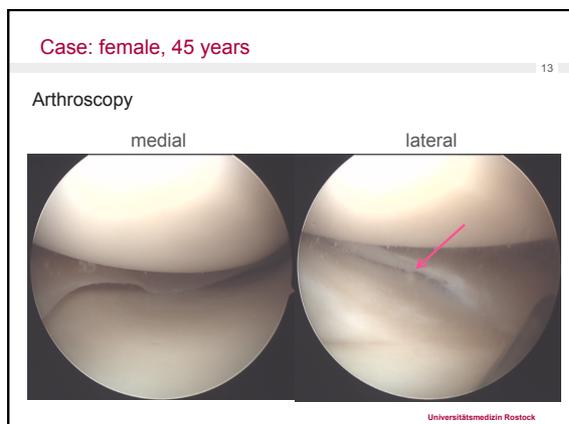

**Pitfalls:**  
 Visualisation (small size of knee, limited space through thickened meniscus)  
 -> sometimes 2.7 scope

Universitätsmedizin Rostock

**Case: female, 45 years** 12

Lateral sided pain  
 Positive meniscus signs

ck

**Outcome** 17

Results after (sub-)total meniscectomy worse than partial in patients aged 9.5 years and follow-up of 4.3 years  
*Lee et al. Arthroscopy 2009*

Partial meniscectomy combined with peripheral repair:  
no reoperation in 28 knees (mean age 9.0 years) after mean follow-up of 51 months  
*Ahn et al. Arthroscopy 2008*

Middle-aged (>40y) patients with discoid meniscus have more varus alignment and higher prevalence of osteoarthritis  
*?Preventive resection at younger age?*  
*Kim et al. J Bone Joint Surg Am 2013*

Universitätsmedizin Rostock

**Take Home** 18

- Careful diagnostics
- Classification (stable/unstable/complete/incomplete/tears/symptoms)
- Individualize treatment
- Arthroscopic treatment
- Most likely favor repair over complete resection
